

Day 1: Your First Python Program

Welcome to Python! Before diving into advanced concepts, let's write the simplest program possible.

```
print("Hello, World!")
```

This one line tells the computer to print a message. Don't underestimate its importance—understanding how code executes step by step will build your foundation.

Key Concept – Syntax

Python uses indentation instead of braces `{ }` to structure code. This makes it more readable and beginner-friendly.

Challenge for Today

1. Print your name.
2. Print a simple math calculation (e.g., `3 * 7`).
3. Print your favorite quote on a new line.
